Water Quality Volume Provided	37,237 CF
Water Quantity Volume Required	122,529 CF
Water Quantity Volume Provided	133,635 CF

## **INTRODUCTION:**

The following report presents the storm water management plan for a development located at the northeast intersection of Hamilton Road and Tech Center Drive in Gahanna, Ohio. The analysis will include new commercial layout, an orthopedic building, roadway, and residential apartments. The storage shall be governed by the release rates set forth in the Franklin County Storm Water Manual guidelines.

The area to the north adds a new orthopedic development (7.55 Ac.), to the east a new road and residential apartment complex (1.57 Ac. and 16.66 Ac.) respectively. A commercial development to the southwest is approximately (13.20 Ac.). The total area considered disturbed in this report is approximately (38.98 Ac.). Tributary areas offsite were considered negligible.

Three ponds will provide water quality and quantity as required. A separate dry pond (Pond 1) for the orthopedic area will be analyzed and drain to the road and a (dry pond) to the southeast (Pond 2). The commercial site will have its own wet pond (Pond 3) which will drain to an existing storm sewer.

## **HYDROLOGIC ANALYSIS:**

All hydrologic parameters were determined using the methodology described in the Franklin County Storm Water Manual guidelines. Both Pre-Development and Post-Development runoff and peak discharge amounts were calculated through HydroCAD version 10.2 software.

All proposed drainage (after storage) will be directed to the existing storm sewer system along Hamilton Road for the commercial site (southwest) and to a ditch on the residential, road and orthopedic portion. The storage shall be governed by the release of the 1 year predeveloped release rate to the critical storm and limited to the 10 year predeveloped rate.

## **PRE-DEVELOPED CONDITIONS (Ortho One Pond 1):**

The pre-developed condition of the site consists of a row crops in good condition.

A pre-developed curve number (CN) of 75 Hydrologic Soil Group (HSG B) was used for the site. The time of concentration used was 10 minutes.

## **POST-DEVELOPED CONDITIONS (Ortho One Pond 1):**

The post developed condition for the site will consist of new buildings and paved parking. The developed curve number, with a (CN) of 91 (HSG D) was used for the site, including 4.62 Ac. paved at CN 98 and 2.93 Ac. at CN 80. The time of concentration used was 8 minutes.

### **PRE-DEVELOPED CONDITIONS (SE Pond 2):**

The pre-developed condition of the site consists of the road area 1.57 Ac, the residential area 16.66 Ac. and the orthopedic area 7.55 Ac. with approximately 7.40 Ac. of row crops and 18.38 Ac. of woods/grass (HSG B).

A pre-developed curve number (CN) of 68 Hydrologic Soil Group (HSG B) was used for the site. The time of concentration used was 18.8 minutes.

### **POST-DEVELOPED CONDITIONS (SE Pond 2):**

The post developed condition for the site will consist of a new road, new parking and apartment buildings with some grass. The developed curve number, with a (CN) of 85 (HSG B) was used for the site with 10.74 Ac. paved at CN 98 and 5.92 Ac. of grass CN 61. The time of concentration used was 17.5 minutes.

### **PRE-DEVELOPED CONDITIONS (SW Pond 3):**

The pre-developed condition of the site consists of a row crops in good condition.

A pre-developed curve number (CN) of 75 Hydrologic Soil Group (HSG B) was used for the 13.20 Ac. site. The time of concentration used was 20.3 minutes.

### **POST-DEVELOPED CONDITIONS (SW Pond 3):**

The post developed condition for the site will consist of new buildings and paved parking. The developed curve number, with a (CN) of 91 (HSG D) was used for the site, including 4.62 Ac. paved at CN 98 and 2.93 Ac. at CN 80. The time of concentration used was 8 minutes.

### **Critical Storm Calculation (Ortho One Pond 1):**

The critical storm is determined by comparing the increase in runoff volume of the 1-year 24-hour rainfall event from the pre-developed condition to that of the post-developed.

Pre-Development 1-Year Storm Event: 0.304 af

Post-Development 1-Year Storm Event: 0.801 af

$$((0.801 \text{ af} - 0.304 \text{ af}) / 0.304 \text{ af}) \times 100\% = 163\% \text{ (25-year critical storm)}$$

### **Critical Storm Calculation (SE Pond 2):**

The critical storm is determined by comparing the increase in runoff volume of the 1-year 24-hour rainfall event from the pre-developed condition to that of the post-developed.

Pre-Development 1-Year Storm Event: 0.465 af

Post-Development 1-Year Storm Event: 1.311 af

$$((1.311 \text{ af} - 0.465 \text{ af}) / 0.465 \text{ af}) \times 100\% = 182\% \text{ (25-year critical storm)}$$

### **Critical Storm Calculation (SW Pond 3):**

The critical storm is determined by comparing the increase in runoff volume of the 1-year 24-hour rainfall event from the pre-developed condition to that of the post-developed.

Pre-Development 1-Year Storm Event:	0.531 af
Post-Development 1-Year Storm Event:	1.559 af
$((1.559 \text{ af} - 0.531 \text{ af}) / 0.531 \text{ af}) \times 100\% = 194\% \text{ (25-year critical storm)}$	

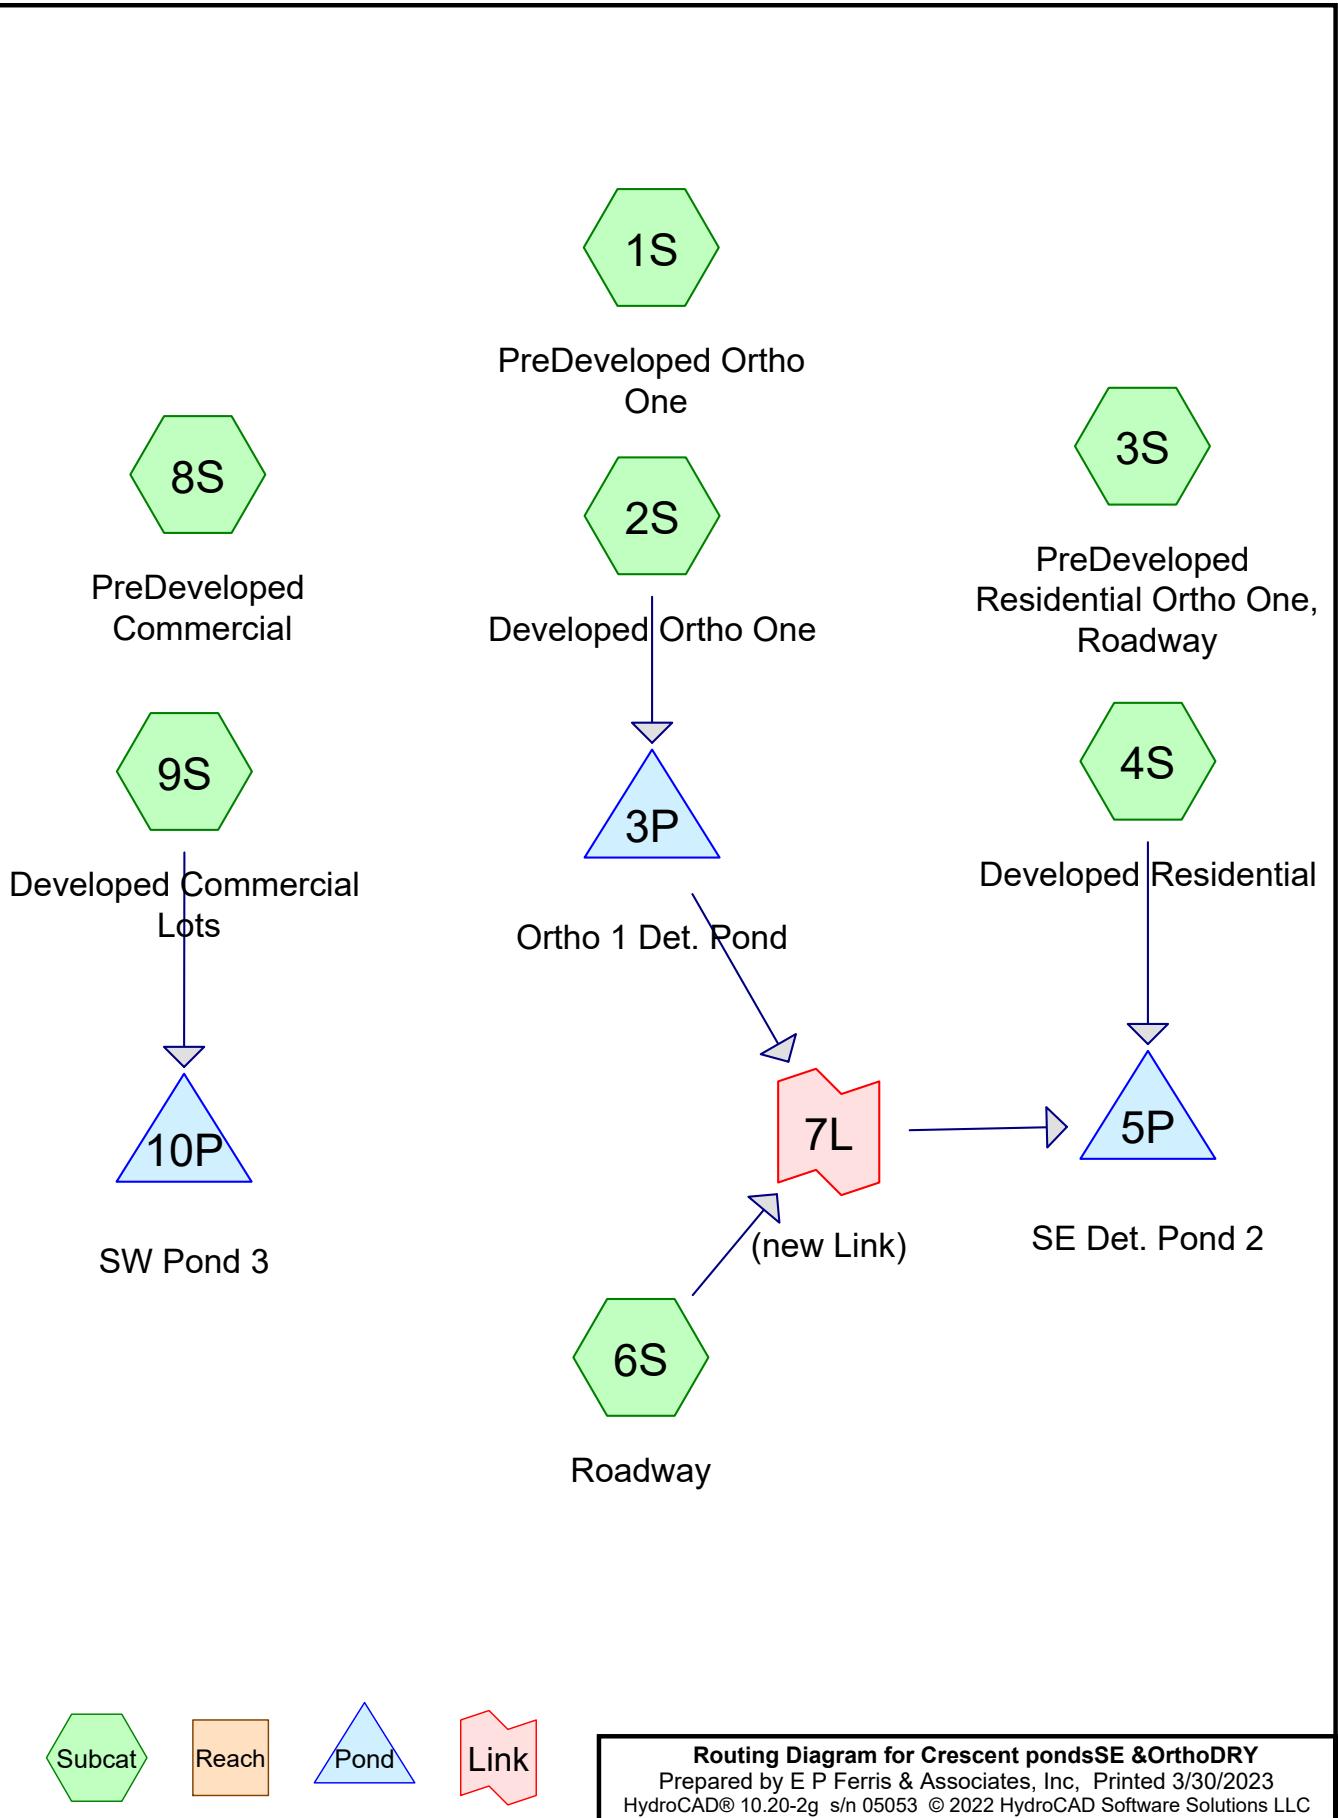

### **WATER QUALITY:**

Water quality for the entire tributary area will be provided in the three proposed ponds. Water Quality calculations with drawdown can be found in Appendix C.

### **SUMMARY:**

The 1 yr. pre-developed rate will not be exceeded to the critical storm. The site will use retention ponds to provide the necessary storage volume to achieve the required release rates from the site. Tributary Maps can be found in Appendix B Water Quality in Appendix C, a Soil Report found in Appendix D and Storm Pipe Calcs. in Appendix E.

# Dry Extended Detention Basin WQv Compliance Tool

version 3.2 2020-07-07

## Project Summary

**Project Name:** Crescent Ortho One  
**Subwatershed ID/Label:** Ortho One Detention Pond  
**Submitted by:** EP Ferris  
**Date:** 3/30/2023

Subwatershed Drainage Area, $A_{total}$ =	7.55	acres	=	328,878	ft <sup>2</sup>
Subwatershed Impervious Area, $A_{imp}$ =	4.45	acres	=	193,842	ft <sup>2</sup>
Imperviousness fraction, $i$ =	0.59			59	%
Water Quality Volume, $WQv$ =	14,318	ft <sup>3</sup>	=	0.33	ac-ft

## Step 1 - Soil Suitability

Soil Series	BeA	HSG	D
-------------	-----	-----	---

## **Step 2 - Dry ED Basin Volume Requirements**

Extended Detention Volume, EDv =	<b>14318</b>	ft <sup>3</sup>
Minimum Sediment Storage Volume, V <sub>sediment</sub> =	<b>2864</b>	ft <sup>3</sup>
Minimum Forebay Volume, V <sub>forebay</sub> =	<b>1432</b>	ft <sup>3</sup>
Minimum Permanent Micropool Volume, V <sub>micropool</sub> =	<b>1432</b>	ft <sup>3</sup>

### **Step 3 - Basin Stage-Storage Relationship**

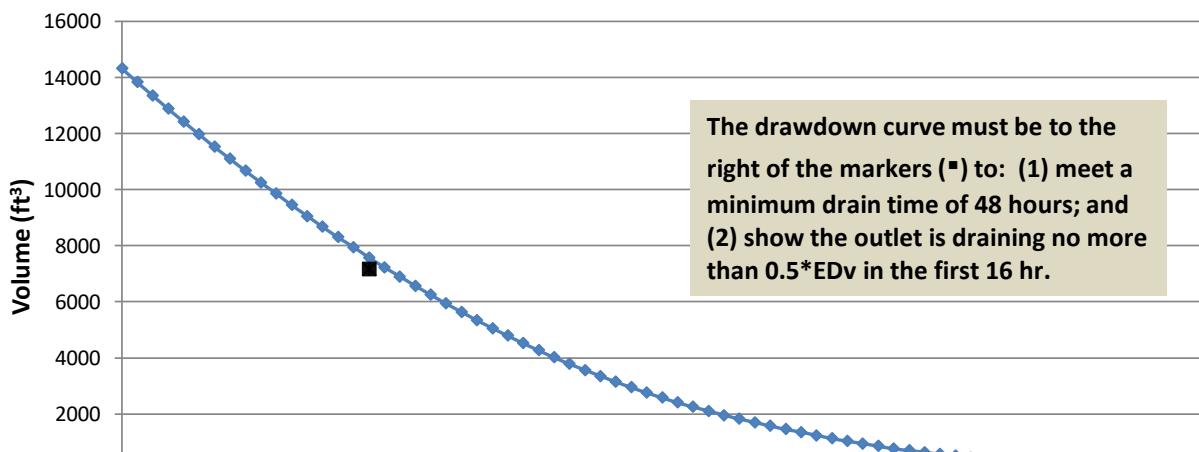

#### Step 4 - Outlet Elevations and Storage Volumes

WQ Orifice Invert Elevation =	785.00		
Elevation of Top of EDv =	786.25		
Secondary Outlet Invert Elevation =	786.30		OKAY
WQ Treatment Volume Provided, $V_{treatment}$ =	14,827 ft <sup>3</sup>		
Treatment Vol Provided Relative to EDv, $V_{treatment}/EDv$ =	1.04	=	104% OKAY
Permanent Pool Volume Provided, PPV =	7,832 ft <sup>3</sup>		
Forebay Volume Provided, $V_{forebay}$ =	2,500 ft <sup>3</sup>	=	1.75
Is forebay volume below WQ outlet? (Yes or No)	Yes	=	175% OKAY
Permanent Micropool Volume Provided, $V_{micropool}$ =	5,332 ft <sup>3</sup>		
Ratio $V_{micropool}$ Provided to $V_{micropool}$ Required =	3.72	=	372% OKAY
Sediment Storage Volume Provided, $V_{sediment}$ =	7,832 ft <sup>3</sup>		
Ratio $V_{sediment}$ Provided to $V_{sediment}$ Required =	2.74	=	274% OKAY

#### Step 5 - Outlet (Orifice) Sizing

Maximum Hydraulic Head, $H_{max}$ =	1.25 ft		
Orifice Coefficient, C =	0.6		
Target (Minimum) Draw-down Time, $T_d$ =	48 hr		
Target Average Discharge, $Q_{avg}$ =	0.08 cfs		
Average Hydraulic Head, $H_{avg}$ =	0.63 ft		
Estimated Orifice Area, $A_{orifice}$ =	3.13 in <sup>2</sup>	=	0.022 ft <sup>2</sup>
Estimated Orifice Diameter, $D_{orifice}$ =	2.00 in	=	0.17 ft
Design Orifice Diameter, $D_{orifice}$ =	2.20 in	=	0.18 ft
Design Orifice Area, $A_{orifice}$ =	3.78 in <sup>2</sup>	=	0.026 ft <sup>2</sup>
Time to Completely Drain EDv, $T_d$ =	>72 hr	must be $\geq 48$ hr	OKAY
Volume Drained in First 16 hr =	6,738 ft <sup>3</sup>		
% of EDv =	47.1 %	must be $\leq 50\%$	OKAY

#### Dry Basin - EDv Drawdown vs Time

## Project Summary

**MAP INFORMATION**

The soil surveys that comprise your AOI were mapped at 1:15,800.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Franklin County, Ohio

Survey Area Data: Version 19, Jun 11, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 4, 2014—Aug 27, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

## Rating Options

*Aggregation Method: Dominant Condition*

*Component Percent Cutoff: None Specified*
