200 S Hamilton Road
Gahanna, Ohio 43230

Re: 1201 Cherry Bottom Road
Academy Park – Development Plan (DP-25-12)
Stormwater Detention Waiver Request

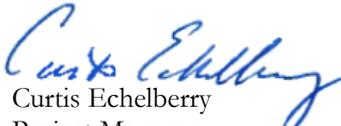

Ms. Boyer,

We have been retained by POD Design and the City of Gahanna Division of Parks and Recreation to provide engineering design services for the Academy Park parking and facility improvements. The park is located inside the Big Walnut Creek floodplain as depicted in Exhibit A and currently does not have any stormwater BMPs in place. With the park land directly abutting and tributary to the Big Walnut Creek, we respectfully request a waiver from the City Stormwater Detention Regulations (1113.02 – Stormwater Management) in accordance with the City Regulations permitting waivers (113.02(e)(2)) for development area abutting and tributary to Big Walnut Creek on which surface water flows directly into the Big Walnut Creek. Our design will include a BMP per Ohio EPA Water Quality Regulations to treat stormwater runoff from the new impervious areas before releasing it to the Big Walnut Creek. Note that the storm water from the existing parking lot and the proposed parking lot expansion area drain into a ditch along the east side of the park that then flows directly into the Big Walnut Creek without crossing any other land parcels. By waiving detention requirements, the release of the peak flows associated with the park lands will enter the creek prior to the peak flow of the creek from upstream tributaries and eliminate adding to the peak.

Please find attached a stormwater management report to support our stance in the request for a waiver.

Thank you for your consideration regarding this request. Should you have questions or require additional information, do not hesitate to contact our office.

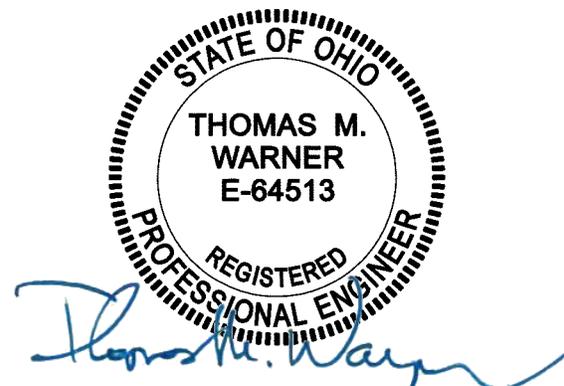

Sincerely,
ADVANCED CIVIL DESIGN

Curtis Echelberry
Project Manager

TABLE OF CONTENTS

SITE SUMMARY:	3
DESIGN METHODOLGY:	3
EXISTING CONDITIONS:	3
CRITICAL STORM:	3-4
POST CONSTRUCTION CONDITIONS:	4-5
STORM WATER QUALITY CONTROL:	6
CONCLUSION:	6

APPENDICES:

APPENDIX A:	TRIBUTARY MAPS
APPENDIX B:	PRE-DEVELOPED HYDROCAD CALCULATIONS
APPENDIX C:	CRITICAL STORM CALCULATIONS
APPENDIX D:	POST-DEVELOPED HYDROCAD CALCULATIONS
APPENDIX E:	WATER QUALITY CALCULATIONS

Site Summary:

The subject project includes various site improvements at the City of Gahanna’s Academy Park property along the west side of Cherry Bottom Road, south of Coldwell Drive in the City of Gahanna. The project will consist of improvements to the existing parking lot, playground, path network and shelter building.

Design Methodology:

Stormwater management calculations within this report follow the guidance of the City of Gahanna’s Stormwater Management Regulations for water quantity requirements, City of Gahanna’s Stormwater Management Regulations and Ohio EPA regulations for water quality requirements. Hydrology and hydraulic were modeled with the HydroCAD software suite using TR-55 methodology and a Type-II rainfall distribution. Stormwater routing for the Johnstown Road Apartments was performed using the storage indication method.

The National Weather Service’s Atlas 14’s precipitation frequency estimates for the 1, 2, 5, 10, 25, 50, and 100-year storm events were used to evaluate rainfall and runoff on the proposed development. Design rainfall depths are given in Table 1.

Design Event	1-yr	2-yr	5-yr	10-yr	25-yr	50-yr	100-yr
Rainfall Depth (in)	2.20	2.63	3.24	3.74	4.44	5.02	5.63

Table 1 - Design Storm Rainfall Depths

Existing Conditions:

Existing drainage conditions were evaluated using a combination of aerial photographs, surveyed topography, soil maps, and site photos. The total park land area existing drainage is split into an eastern watershed and a western watershed. The subject area (disturbed area) of the park is a part of the eastern watershed, tributary to the eastern drainage channel directly tributary to the Big Walnut Creek.

The Natural Resource Conservation Service Web Soil Survey identifies the predominant on-site soil as Crane silt loam, Eldean silt loam, Sloan silt loam, Udorthents, and Warsaw silt loam. These soils are classified within hydrologic group “B”. Time of concentration for the drainage areas were computed using TR-55 methodology. Peak rates of runoff for the drainage areas were computed using the HydroCAD calculation suite. The table below includes the predeveloped conditions of the site area.

Tributary Area Name	Area (acre)	CN	Tc	Q1	Q2	Q5	Q10	Q25	Q50	Q100
			(min)	(cfs)	(cfs)	(cfs)	(cfs)	(cfs)	(cfs)	
Watershed	5.92	80	15.9	4.84	7.08	10.52	13.49	17.80	21.46	25.36

Table 2 - Pre-Developed Hydrology Summary

Critical Storm:

The City of Gahanna’s Stormwater Management Regulations requires that the development follow its critical storm methodology. The allowable release rates are determined by utilizing the TR-55 methodology to calculate the percentage of increased in runoff volume due to the increase in impervious areas in the watershed. For all storm events up to and including the critical storm, runoff must be discharged from the site at a rate not to exceed the 1-year predeveloped runoff rate. Storm events with less frequent recurrence intervals from than the critical storm may not exceed the pre-developed peak rate from the same storm event. Using the TR-55 method, runoff volumes from a 2.2-inch rainfall event (1-yr) were calculated with composite pre-development and post-development curve

numbers computed as 80 and 91, respectively. The 90.5% increase in runoff volume due to the added impervious area of the development equates to a 10-yr critical storm event.

Ex. Impervious Area (ac.)	Ex. 1-Yr Runoff Volume (ac. ft.)	Prop. Impervious Area (ac.)	Prop. 1-Yr Runoff Volume (ac. ft.)	Percent Increase	Critical Storm
3.112	0.338	4.822	0.660	90.5%	10-Yr

Table 3 – Critical Storm Summary

The table below summarizes the allowable release rates for the watershed based on the 10-yr critical storm event calculated above.

AREA	1-yr	2-yr	5-yr	10-yr	25-yr	50-yr	100-yr
Watershed	4.84	4.84	4.84	4.84	17.80	21.46	25.36

Table 4 – Allowable Release Rates

Post-Construction Conditions:

The land use of this development will remain a public park facility. The project is just upgrading the amenities of the park facility along with gaining some additional parking with the parking lot expansion. Part of the improvements will be installing storm catch basins and sewers in the existing and proposed parking lot areas to add surface and subsurface drainage to improve the life of the pavement areas. Along with that a water quality basin will be constructed to treat the collected water before releasing it into the Big Walnut Creek.

Storm Water Quantity Control:

The park is located inside the Big Walnut Creek floodplain as depicted in the tributary maps and currently does not have any stormwater BMPs in place. With the park land directly abutting and tributary to the Big Walnut Creek, we respectfully request a waiver from the City Stormwater Detention Regulations (1113.02 – Stormwater Management) in accordance with the City Regulations permitting waivers (113.02(e)(2)) for development area abutting and tributary to Big Walnut Creek on which surface water flows directly into the Big Walnut Creek. Our design does include a BMP per Ohio EPA Water Quality Regulations to treat stormwater runoff before releasing it to the Big Walnut Creek. Note that the stormwater from the existing parking lot and the proposed parking lot expansion area drain into a ditch along the east side of the park that then flows directly into the Big Walnut Creek without crossing any other land parcels. By waiving detention requirements, the release of the peak flows associated with the park lands will enter the creek prior to the peak flow of the creek from upstream tributaries and eliminate adding to the peak.

We have prepared Predevelopment runoff rates with a model of offsite flows directly tributary to the planned stormwater runoff outlet to evaluate how the two interact with different time intervals and tributary areas to show that waiving the detention require will not be detrimental to the channel.

Tributary Area Name	Area (acre)	CN	Tc	Q1	Q2	Q5	Q10	Q25	Q50	Q100
			(min)	(cfs)	(cfs)	(cfs)	(cfs)	(cfs)	(cfs)	
Onsite Watershed	5.92	80	15.9	4.84	7.08	10.52	13.49	17.80	21.46	25.36
Offsite Watershed	377.60	77	51.6	107.10	168.40	265.92	352.32	480.05	590.15	708.25
Composite	383.52	-	-	105.45	166.32	262.73	348.07	474.26	583.04	700.37

Table 5 - Pre-Developed Analysis

Tributary Area Name	Area (acre)	CN	Tc	Q1	Q2	Q5	Q10	Q25	Q50	Q100
			(min)	(cfs)						
Onsite Watershed	5.92	91	10	11.91	15.23	19.97	23.86	29.28	33.76	38.45
WQ Basin Release	5.92	-	-	9.07	13.46	18.39	22.25	27.57	31.96	36.54
Offsite Watershed	377.60	77	51.6	107.10	168.40	265.92	352.32	480.05	590.15	708.25
Composite	383.52	-	-	106.30	166.94	263.02	346.36	471.19	579.25	695.72

Table 6 - Post-Developed Analysis

The table below shows that the increase in runoff is greatest at the 1-yr event (0.85 cfs) but decreases in every storm event after to the point that the runoff during the 10-yr event and greater, are less than the pre-development composites.

Tributary Area Name	Q1	Q2	Q5	Q10	Q25	Q50	Q100
	(cfs)						
Pre-Composite	105.45	166.32	262.73	348.07	474.26	583.04	700.37
Post-Composite	106.30	166.94	263.02	346.36	471.19	579.25	695.72

Table 7 – Comparison of Flows Pre to Post

The proposed post-development runoff rates are higher than those of the same storm events in the predevelopment condition. The analysis shows that due to the time interval due to not detaining those post-development storm events the overall composite flows both in flow and velocity are not detrimental to the outfall channel. We feel that the reason the 1, 2, and 5-yr events are showing higher composite release rates due to the water quality basin function releasing those events at a higher time interval getting closer to the offsite peak time interval. If you run the model without the water quality basin you get the following composite release rates, showing lower runoff rates due to the change in the time interval.

Tributary Area Name	Q1	Q2	Q5	Q10	Q25	Q50	Q100
	(cfs)						
Pre-Composite	105.45	166.32	262.73	348.07	474.26	583.04	700.37
Post-Composite	106.30	166.94	263.02	346.36	471.19	579.25	695.72
Post-Composite Undetained	105.70	166.49	262.76	347.96	473.92	582.51	699.61

Table 8 – Comparison of Flows Pre to Post and without WQ Basin

Furthermore, looking at the channel analysis at the velocities within the channel to ensure that velocities are not a contributing factor to channel erosion. Higher velocities have a bigger impact on channel erosion than increase in volume. Below is a table comparing these velocities. The analysis shows that the velocities are nearly identical with a few minor differences of 0.01 fps +/- in a few of the storm events. These differences are not concerning as only the 1-yr event is showing greater velocity and not enough to be detrimental to the channel.

Tributary Area Name	Q1	Q2	Q5	Q10	Q25	Q50	Q100
	(fps)						
Pre-Composite	4.60	5.26	5.83	6.11	6.36	6.49	6.60
Post-Composite	4.61	5.26	5.83	6.10	6.35	6.49	6.59

Table 9 – Comparison of Channel Velocities Pre to Post

Storm Water Quality Control:

Per the Ohio EPA General Construction Permit, a stormwater best management practice (BMP) is required to treat the first flush runoff volume produced by a 0.90" rainfall event. The water quality volume was calculated using the equation below with runoff coefficients from the Ohio EPA's General Construction Permit. See Appendix E for full calculations.

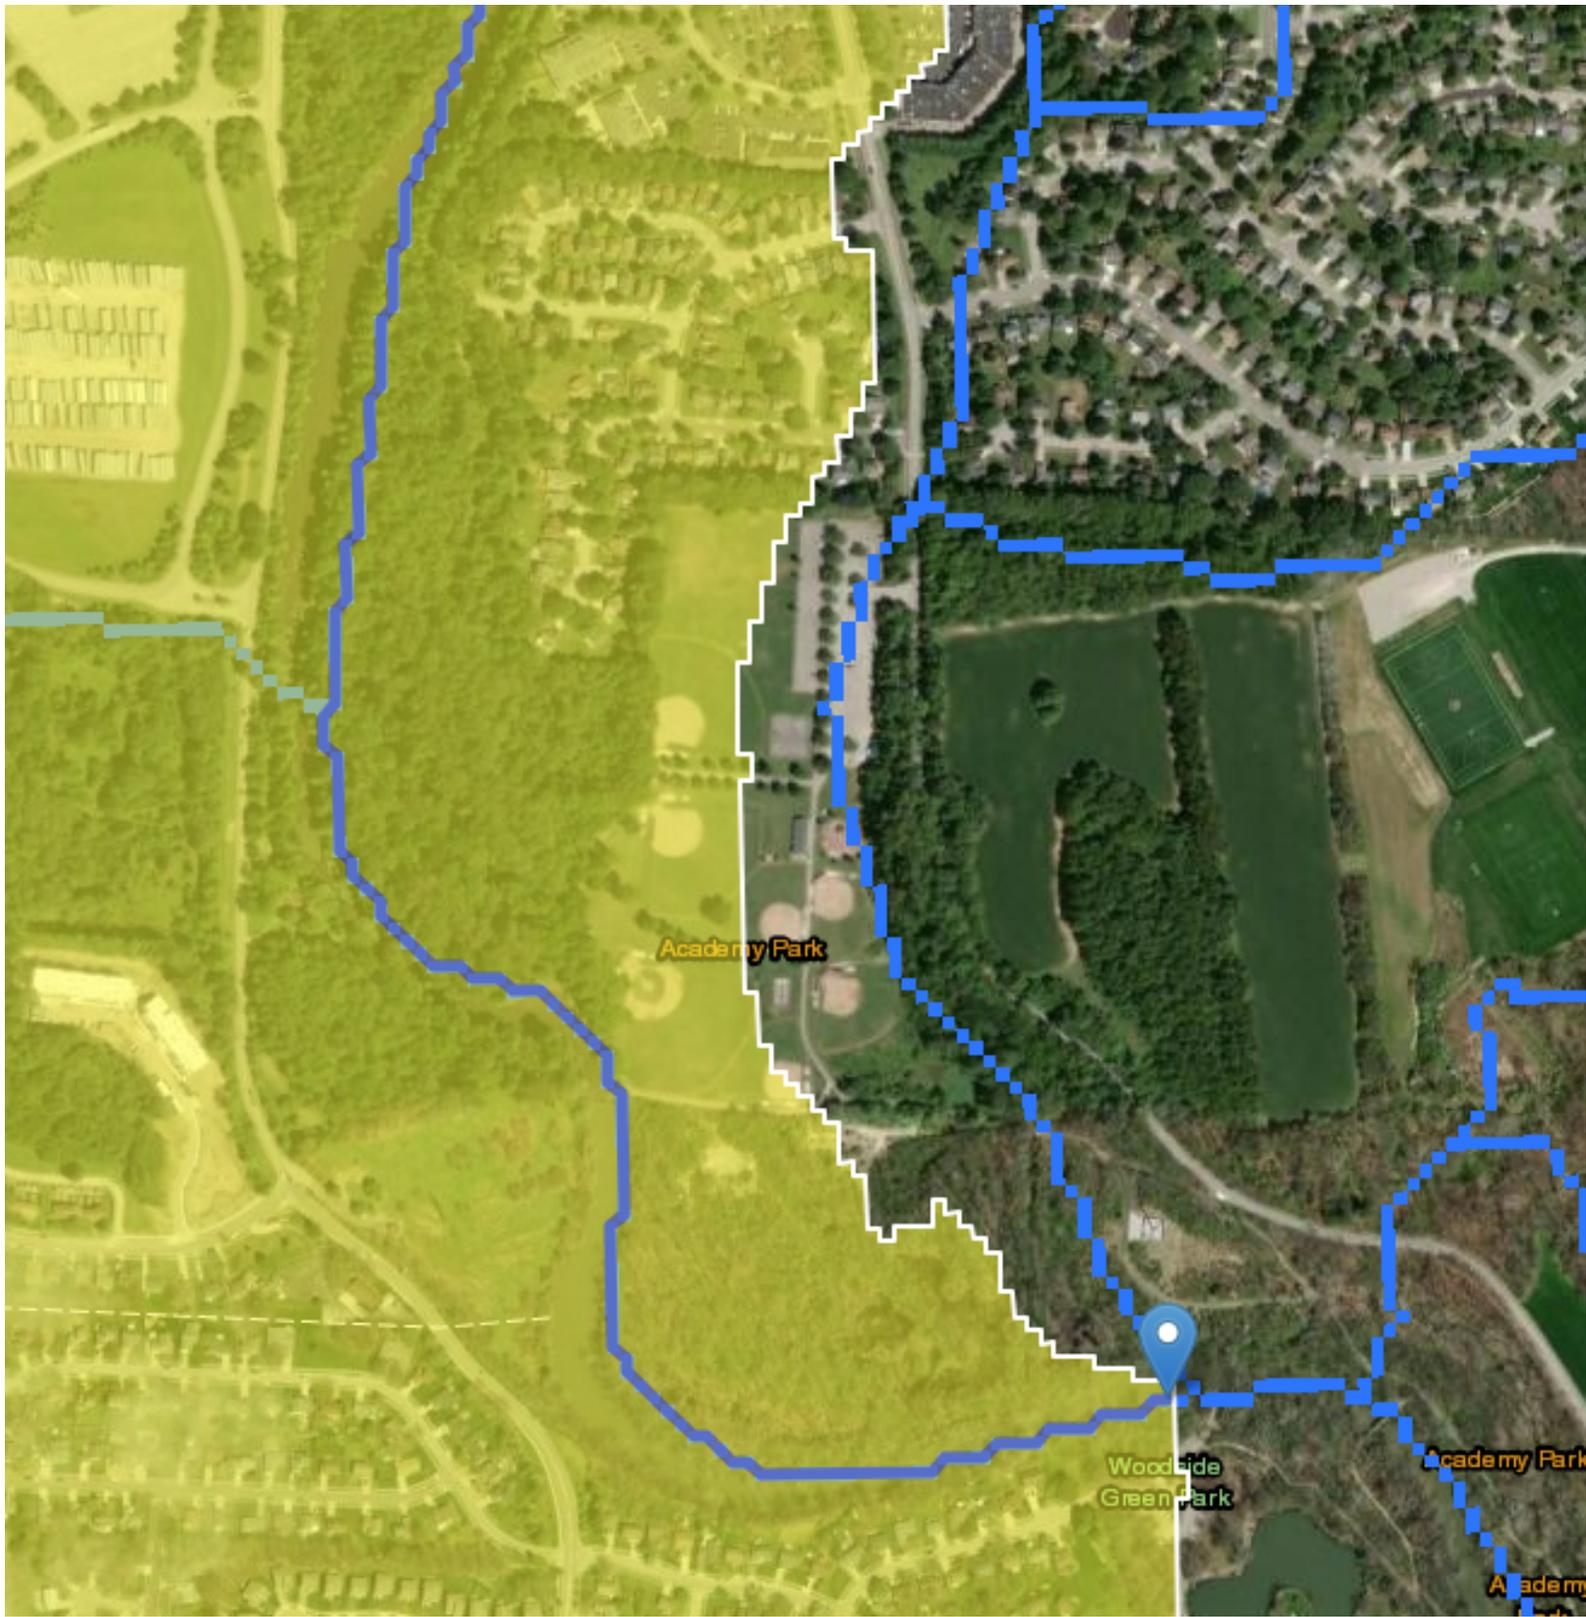

$$WQv = [(0.2 \times Rv1) + (Rv2 - Rv1)] \times P \times A / 12 = 7,052 \text{ cu. ft.}$$

Conclusion:

We feel the development meets the criteria listed in the City Regulations, Section 1113.02 Stormwater Management, subsection (1113.02(e)(1) – the runoff is controlled to ensure that it does not damage the receiving waters as outlines in Table 7, (2) – the site is directly abutting and tributary to the Big Walnut Creek, (4) – we are meeting the local, state and federal requirements by installing a water quality basin to treat the runoff per Ohio EPA regulation prior to releasing from the site.

WATER QUALITY CALCULATIONS

Academy Park

NPDES Water Quality Requirements

New Development $WQv = (Rv * P * A) / 12$

Redevelopment $WQv = [(0.2 * Rv1) + (Rv2 - Rv1)] * P * A / 12$

1. Is this project New Development or Redevelopment?	
Answer:	Redevelopment
WQv =	Water Quality Volume (ac.ft.)
Rv1 =	Volumetric runoff coefficient for existing conditions
Rv2 =	Volumetric runoff coefficient for proposed conditions
P =	.90-in precipitation depth (inch)
A =	Area draining into the BMP in acres

2. Determine Percent Impervious (Pre)		
Land Use	Acre	% Total
Impervious	3.112	53%
Pervious	2.808	47%
Total Area	5.920	

2. Determine Percent Impervious (Post)		
Land Use	Acre	% Total
Impervious	4.822	81%
Pervious	1.098	19%
Total Area	5.920	

Water Quality Volume	WQv	=	[(0.2 x Rv1) + (Rv2 - Rv1)]	x	P	x	A	/	12
	Volume		in. Ac.						
ac.ft.	0.1619	=	[(0.20 x 0.52) + (0.78 - 0.52)]	x	0.90	x	5.92	/	12
cu. ft.	7,052								

Water Quality Volume Required	
TWQv =	7,052 CF

3. Determine Runoff Coefficient	
$Rv = 0.05 + 0.9 * i$	
Rv1 =	0.52
Rv2 =	0.78

Step 4 - Outlet Elevations and Storage Volumes

WQ Orifice Invert Elevation =	801.30	
Elevation of Top of EDv =	803.15	
Secondary Outlet Invert Elevation =	803.30	OKAY
WQ Treatment Volume Provided, $V_{\text{treatment}}$ =	7,943 ft ³	
Treatment Vol Provided Relative to EDv, $V_{\text{treatment}}/EDv$ =	1.13	= 113% OKAY
Permanent Pool Volume Provided, PPv =	1,807 ft ³	
Forebay Volume Provided, V_{forebay} =	994 ft ³	= 1.41
Is forebay volume below WQ outlet? (Yes or No)	Yes	= 141% OKAY
Permanent Micropool Volume Provided, $V_{\text{micropool}}$ =	813 ft ³	
Ratio $V_{\text{micropool}}$ Provided to $V_{\text{micropool}}$ Required =	1.15	= 115% OKAY
Sediment Storage Volume Provided, V_{sediment} =	1,807 ft ³	
Ratio V_{sediment} Provided to V_{sediment} Required =	1.28	= 128% OKAY

Step 5 - Outlet (Orifice) Sizing

Maximum Hydraulic Head, H_{max} =	1.85 ft	
Orifice Coefficient, C =	0.6	
Target (Minimum) Draw-down Time, T_d =	48 hr	
Target Average Discharge, Q_{avg} =	0.04 cfs	
Average Hydraulic Head, H_{avg} =	0.93 ft	
Estimated Orifice Area, A_{orifice} =	1.27 in ²	= 0.009 ft ²
Estimated Orifice Diameter, D_{orifice} =	1.27 in	= 0.11 ft
Design Orifice Diameter, D_{orifice} =	1.20 in	= 0.10 ft
Design Orifice Area, A_{orifice} =	1.12 in ²	= 0.008 ft ²
Time to Completely Drain EDv, T_d =	69 hr	must be \geq 48 hr OKAY
Volume Drained in First 16 hr =	2,676 ft ³	
% of EDv =	37.9 %	must be \leq 50% OKAY

Dry Basin - EDv Drawdown vs Time
